

Ideas don't simply come and go: ∞

∞ they expand infinitely until interrupted

A Fractal thinker

is a person who has expansively hyper-aware internal moments which appear inattentive to others.

They process external variables using intricate variations of possible outcomes and examine the interrelationships between prior understandings.

I see my students struggle to stay attuned to the mundane as their minds float in the world of

possibility and interconnectedness;
their thoughts branching
exponentially **like fractals**,
ever more complex,
more compelling,
less willing to return to the present
moment.

***Fractal Thinking* is a gift of
creativity; a curse to linear thinking.**

The conduit to the infinite
is what my students need at their
core.

**My job is to help them find a tether
to Now and Here,
linking them to others who may
not understand.**
